The Gates Sonic Tension Meter measures belt span tension easily and accurately. Belt tension is measured by plucking the belt span while holding a sensor close by. Belt tension is adjusted until the belt span frequency, or measured tension level is within manufacturer’s recommendations. The final step is to operate the belt drive system for a few hours, allowing the belts to stretch and seat properly in the pulley grooves.

V Belt Tension Methods & Instructions | Easily Align Pulleys

As belts operate, belt tension applies a wedging force perpendicular to their tops, pushing their sidewalls against the sides of the sheave grooves, which multiplies frictional forces that allow the drive to transmit higher loads.

Table 1 gives general tensioning values for a particular belt cross section in relation to the pulley diameter. There are three testers (gauges) that cov- er most of the V-belt range: Gauge 1 – range: 15–70 kg Gauge 2 – range: 50–150 kg Gauge 3 – range: 150–300 kg.

Place the plunger end of the tension gauge on the top of the belt. Holding the tension gauge vertical to the belt press down until the bottom of the “O” ring on the plunger is even with the top of the wood. Lift the plunger from the belt, and read the pounds of force measurement at the “O” ring on the plunger.

Tension ranges above are for drives requiring single belts. If multiple belts are needed for a drive, divide tension by number of belts to give per belt tension to be measured. Step 2: Run belt for five minutes. Step 3: If belt tension drops below Suggested Tension range, retighten belt to Installation Tension.

Proper belt tension is a critical step when installing a belt. V-belts operate on friction; the friction is multiplied by the mechanical advantage of the wedging principle. Correct V-Belt tensioning is the single most important factor necessary for long, satisfactory operation.

(Calculates the force exerted by an endless belt on a pulley, i.e., the force of two belt strands) We recommend stretching most unreinforced round belts at least 5%. The calculated tensions are less accurate above 25% stretch. Usually 83A/85A durometer round belts are stretched 10-12%, and 92A/95A durometer belts are stretched 7-9%.
